

SOC Analyst Training Lab

Investigation Worksheet

Alert Triage · Rule Mapping · MITRE ATT&CK · Analyst Recommendation

Prepared by: KHIZAR UL ISLAM

Endpoint: Khizar-Malik-Windows11 (agent ID 001)

How This Worksheet Works

Each investigation below documents one Wazuh alert generated during Lab 1: what fired, why, the supporting evidence from the raw event, and the analyst's call on whether it is a real threat. A blank template is included at the end for future alerts.

Investigation 1 — Multiple Windows Logon Failures

Alert Title	Multiple Windows Logon Failures
Time	Jul 8, 2026 @ 10:28:45.778
Rule ID	60204 (aggregates rule 60122 — Logon Failure: Unknown user or bad password)
Severity	Level 10 — High
MITRE ATT&CK	T1110 — Brute Force (Credential Access). Wazuh's default ruleset tags rule 60204 directly with T1110.
Evidence	Three consecutive "Logon Failure - Unknown user or bad password" events (rule 60122, level 5) fired within seconds of each other on agent Khizar-Malik-Windows11, which Wazuh's frequency rule correlated and escalated to rule 60204.
Recommendation	Confirm whether the failures were self-generated (as in this lab) or from an unrecognized source. If unexpected, check the source IP and target account, verify the account lockout policy, and watch for continued attempts or a following successful logon (which would indicate a successful brute force).
Conclusion	True Positive (as designed) — the failed logins were intentionally triggered by the student to test detection; confirmed no real account compromise.

The screenshot shows the Wazuh Discover interface with a timeline view. The timeline shows events from Jul 7, 2026 @ 10:31:13.797 to Jul 8, 2026 @ 10:31:13.797. The table below represents the data shown in the timeline:

timestamp	agent.name	rule.description	rule.level	rule.id
Jul 8, 2026 @ 10:28:48.468	Khizar-Malik-Windows11	Non service account logged off.	3	67023
Jul 8, 2026 @ 10:28:48.443	Khizar-Malik-Windows11	Non service account logged off.	3	67023
Jul 8, 2026 @ 10:28:48.395	Khizar-Malik-Windows11	Special privileges assigned to new logon.	3	67026
Jul 8, 2026 @ 10:28:48.347	Khizar-Malik-Windows11	Windows Workstation Logon Success	3	60118
Jul 8, 2026 @ 10:28:48.256	Khizar-Malik-Windows11	Windows Workstation Logon Success	3	60118
Jul 8, 2026 @ 10:28:45.778	Khizar-Malik-Windows11	Multiple Windows Logon Failures	10	60204
Jul 8, 2026 @ 10:28:43.739	Khizar-Malik-Windows11	Logon Failure - Unknown user or bad password	5	60122
Jul 8, 2026 @ 10:28:41.220	Khizar-Malik-Windows11	Logon Failure - Unknown user or bad password	5	60122
Jul 8, 2026 @ 10:28:32.790	Khizar-Malik-Windows11	Logon Failure - Unknown user or bad password	5	60122
Jul 8, 2026 @ 10:28:08.655	Khizar-Malik-Windows11	Non service account logged off.	3	67023
Jul 8, 2026 @ 10:28:08.655	Khizar-Malik-Windows11	Non service account logged off.	3	67023
Jul 8, 2026 @ 10:28:08.620	Khizar-Malik-Windows11	Special privileges assigned to new logon.	3	67026

Figure 1 — Wazuh Discover view: 3x "Logon Failure" (rule 60122) escalating to "Multiple Windows Logon Failures" (rule 60204, level 10).

Investigation 2 — Process Creation — whoami.exe

Alert Title	A process was created — whoami.exe
Time	Jul 8, 2026 @ 11:03:15.222
Rule ID	67027
Severity	Level 3 — Low / Informational
MITRE ATT&CK	None by default — rule 67027 is a baseline telemetry rule (Windows Event ID 4688) with no built-in MITRE tag. Analyst note: whoami itself aligns with T1033 — System Owner/User Discovery if performed by an attacker.
Evidence	New Process Name = C:\Windows\System32\whoami.exe, Parent Process Name = cmd.exe, Subject User = Malik, Computer = DESKTOP-I40SG76.
Recommendation	No action needed in this context — a routine diagnostic command run interactively by the logged-in user during a monitoring exercise. In a real investigation, would check whether whoami was spawned from an unexpected parent process (e.g. a script or macro) rather than an interactive shell.
Conclusion	expected lab activity, no suspicious process lineage.

The screenshot displays the Wazuh Threat Hunting dashboard. A search filter is applied: `data.win.eventdata.newProcessName: "whoami"`. The main panel shows a list of events. A 'Document Details' modal is open, displaying the following JSON data:

```

{
  "index": "wazuh-alerts-4.x-2026.07.08",
  "agent.id": "001",
  "agent.ip": "192.168.44.1",
  "agent.name": "Khizar-Malik-Windows11",
  "data.win.eventdata.mandatoryLabel": "S-1-16-12288",
  "data.win.eventdata.newProcessId": "0x3bf9",
  "data.win.eventdata.newProcessName": "C:\\Windows\\System32\\whoami.exe",
  "data.win.eventdata.parentProcessName": "C:\\Windows\\System32\\cmd.exe",
  "data.win.eventdata.processId": "0xb9c",
  "data.win.eventdata.subjectDo": "DESKTOP-I40SG76",
  "data.win.eventdata.subjectLogonId": "0x29e0",

  "eventid": "4688"
}

```

Figure 6 — Document details confirming `whoami.exe`, parent process `cmd.exe`.

Investigation 3 — Process Creation — Notepad.exe

Alert Title	A process was created — Notepad.exe
Time	Jul 8, 2026 @ 11:27:09.642
Rule ID	67027
Severity	Level 3 — Low / Informational
MITRE ATT&CK	None by default — same baseline rule as above; GUI application launches don't map to a specific ATT&CK technique on their own.
Evidence	New Process Name = C:\Program Files\WindowsApps\Microsoft.WindowsNotepad_11.2605.29.0_x64__8wekyb3d8bbwe\Notepad\Notepad.exe, Subject User = Malik. Notepad's modern Windows 11 Store package path differs from the classic System32 path.
Recommendation	No action needed — routine GUI application launch by the logged-in user. Useful to remember for future investigations: the Store-app path is the expected one on Windows 11, so don't mistake it for an unusual binary location.
Conclusion	normal user activity.

Document Details	
Table	JSON
index	wazuh-alerts-4.x-2026.07.08
agent.id	001
